5.8	System Administrator	Implement Role-Based Access Control	High

Acceptance Criteria:

5.1 - Add New Medicine

 Pharmacist should be able to add a new medicine with details like name, category, price, expiry date, and stock level.

5.2 - Update Medicine Information

 Pharmacist should be able to update existing medicine details to maintain accurate stock information.

5.3 - Delete Expired Medicines

 Store Manager should be able to remove expired medicines from the inventory to prevent sales of outdated drugs.

5.4 - Monitor Stock Levels

 Store Manager should receive real-time insights about stock levels and identify medicines that need restocking.

5.5 - Check Stock Before Sale

 Cashier should be able to check if a medicine is in stock before completing a sale to avoid unfulfilled orders.

Product Backlog - Medical Store Inventory System

5.6 - Generate Inventory Reports

Store Manager should be able to generate reports on stock levels and sales trends for informed decision-making.

5.7 - Send Low Stock Notifications

The system should automatically notify store managers when stock levels drop below a certain threshold.

5.8 - Implement Role-Based Access Control

System Administrator should be able to assign and manage user roles to restrict access to functionalities.
